Management of Methanol-Fueled Bulk Carriers

We are pleased to announce that our company has been entrusted with the management of our group's first methanol-fueled bulk carrier (dual-fuel vessel). This new management responsibility follows our experience with LNG carriers and methanol carriers.

By utilizing methanol as fuel, this vessel is expected to significantly reduce greenhouse gas (GHG) emissions compared to conventional fuel oil. Through the management of this vessel, we aim to further accumulate expertise in ship management in the field of clean, next-generation fuels, thereby contributing to the enhancement of our technical capabilities in this field.

Through the continued management of dual-fuel vessels and vessels equipped with environmental load reduction technologies, we aim to continue the development of ship management and take on challenges as a unified group to realize a sustainable and environmentally friendly future.
